

Delivering location content and services

Why switch to emapsite?

- ▶ Ordnance Survey plus other UK data sources
- ▶ Application ready, managed data services platform
- ▶ Flexible, standards based (OGC) and scalable service options
- ▶ Achieve significant business process efficiencies
- ▶ Reduce your data acquisition and management cost

Recognising the significant challenges facing organisations in improving business efficiencies and establishing the 'single point of truth' for location data, emapsite has built a services platform that offers application ready solutions. These include Ordnance Survey content available as OGC web services (WMS / WFS / WMTS), hosted applications such as emapsite express, ContractorLink, GeoLink and Plans Ahead, all of which enable wider and easier access to licensed geo-content on demand.

The following examples demonstrate where emapsite can add value and help achieve significant efficiency gains across the sector.

UK Water company

3 year contract

emapsite is providing data, web services and consultancy to a major water utility on a range of GI challenges including migration from "old" to "new" products such as OS Address Layer 2 to OS AddressBase Premium, OS 1:10 000 scale colour raster to OS VML and in the adoption of OGC standards such as WMS, WFS and WMTS for improved data distribution and scalability.

Included within the contract are a range of additional services including OGC web mapping service, use of ContractorLink, emapsite's distribution portal for contractors, and emapsite express for simplified automated data extract provisioning across the business respectively.

UK Infrastructure Company

12 month contract

emapsite provides an enterprise managed web mapping service (WMTS and WMS) that hosts OS MasterMap, OS Imagery and other OS content layers as a masked AOI covering the total extent of their infrastructure. emapsite was unique in being able to build a custom map service that met the client's strict specifications and could be consumed by their multiple applications and importantly provide the speed of delivery that would allow rapid scaling to thousands of users. The web service is now accessible by all staff and underpins the business' asset management programmes and provides visibility of OS data of their infrastructure to a far wider audience. There are now plans to roll this out to mobile devices to better enable field force deployment.

UK Energy Company

Annual rolling contract

A client for over 10 years, this major UK Energy giant has migrated all data licences and data services to emapsite. This data portfolio is now licensed on a rolling annual licence and includes all OS mapping layers for country coverage, sub-national regions and project development areas on demand, including OS MasterMap, Address, Imagery, Terrain and Raster layers. This can be accessed via GeoLink which maps licensed content for their development programme online, enabling access by project reference. emapsite also provides the OS data as a WMS service into their GIS system, emapsite express, a web hosted data transformation service and ContractorLink, emapsite's distribution portal for contractors.
